

Session 2 + Important Announcement

Date Started: 13th December 2025

The goal of this research project has been changed from “What do teenagers remember more : Social context or facts?” to “The cognitive style of teenagers, their motivation behind it, how they approached the task, and the outcome.”

The main goal has such a dramatic change because when I was observed the received responses, I noticed a great variety of response styles so I decided to embrace the variability and analyze multiple dimensions.

Goal: Wait till the respondents reach 100

Actions Taken: The focus has been changed — the behavior response styles matter now

Observations: As I stated before, many patterns of responses were found, like: high-effort cognitive responders, avoidance responders, and affective responders. Also, my findings (Only from this project) indicated random styles rather than genders following “expected” patterns. So cognitive style matters more than gender.

Changes: Stated above. And the name of the project has been changed from “The Science of Secrets: How Teen Brains Prioritize Social Information” to “How Teenagers Respond to Mixed Information: Individual Cognitive Strategies and Recall Behavior”

Next Step: Wait.
